INSTALLATION GUIDE

202020 — Installation Guide

This app is not distributed through an app market, so Android will show three security prompts during installation. Follow the 6 steps below to finish — the whole process takes about 40 seconds.

Version v1.7.10 | 6 steps | Example: HONOR phone | No PC required

Device note: this guide uses a **HONOR phone as the example** — wording and dialog layout come from that device. Other Android phones (Huawei, Xiaomi, OPPO, vivo, Samsung, Pixel…) follow the **same basic steps** (allow unknown sources → confirm risk → install → identity verification), but the exact wording and button placement may differ slightly.

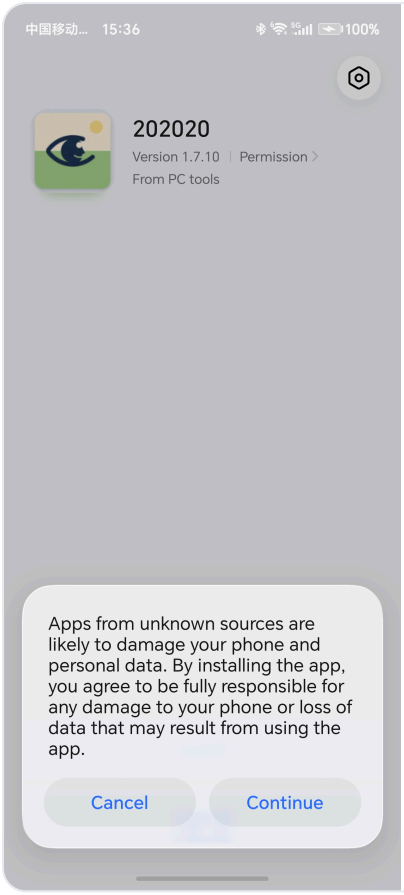

Before you start

- The installer file (`.apk`) is already on the phone — via WeChat / QQ / cloud drive / USB cable, anything that lets you tap it open.
- At least 200 MB of free storage, and a charged battery (installation is quick; this is just to avoid an interruption).
- Have your fingerprint or lock-screen password ready: **Step 5** requires a system-level verification, which is standard for non-market installs on HONOR.
- Prompts like "not verified by the app market / may be harmful" are **generic** for all non-market apps — they do not indicate a problem with this app.

Six steps at a glance

#	What you will see	What to tap
1	"Unknown sources" risk dialog (Cancel / Continue)	Continue
2	Installer detail page — **Install is greyed out**	Check the version number, do nothing else
3	Same page, risk checkbox at the bottom	Tick "I acknowledge…"
4	Safe mode card after tapping Install	Tap the blue Allow installation link inside the text
5	Fingerprint verification dialog	Scan your fingerprint, or tap Use password
6	Green check mark — Installed	Done

Step by step

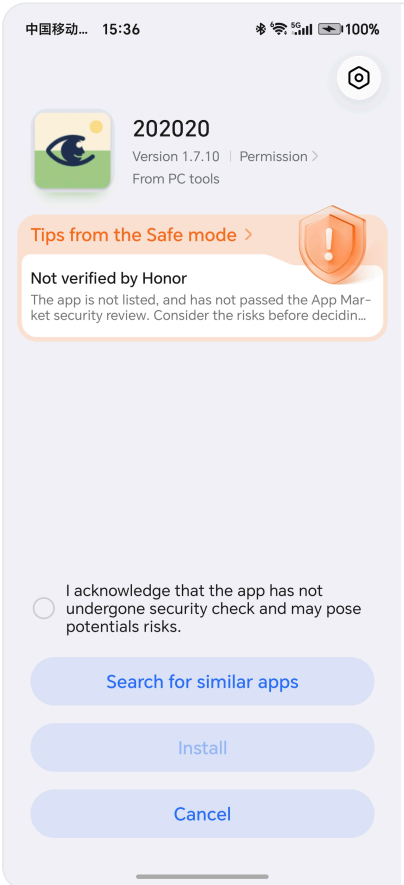

1 UNKNOWN SOURCES

Open the APK file, then tap Continue

Open the APK from your file manager or chat history. Android shows its standard disclaimer: "Apps from unknown sources are likely to damage your phone...".

At the top you can confirm the app name **202020** and version **Version 1.7.10**. If the version does not match what you expect, stop here.

> Tap **Continue** at the bottom right (not Cancel).

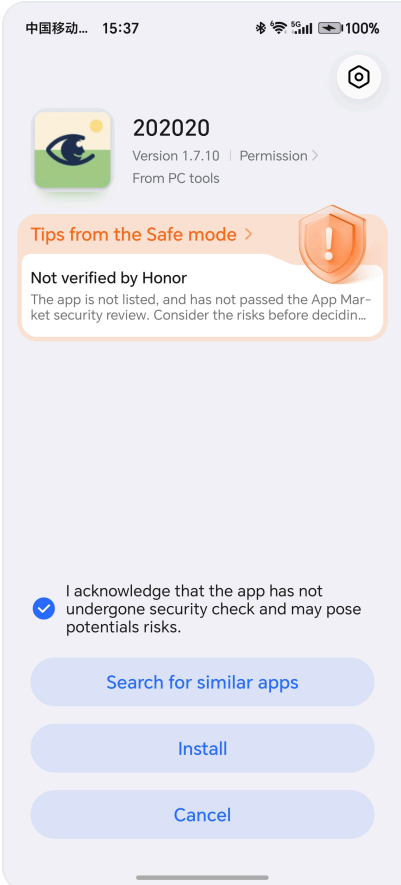

2 REVIEW

The installer page — Install is grey for now

The page shows the app name and version; an orange banner warns **Not verified by Honor** (not reviewed by the HONOR App Market). The **Install** button at the bottom looks pale and does not respond — **this is normal**, not a freeze.

> **Why it is disabled:** you must first tick the risk acknowledgement below; the button unlocks in the next step.

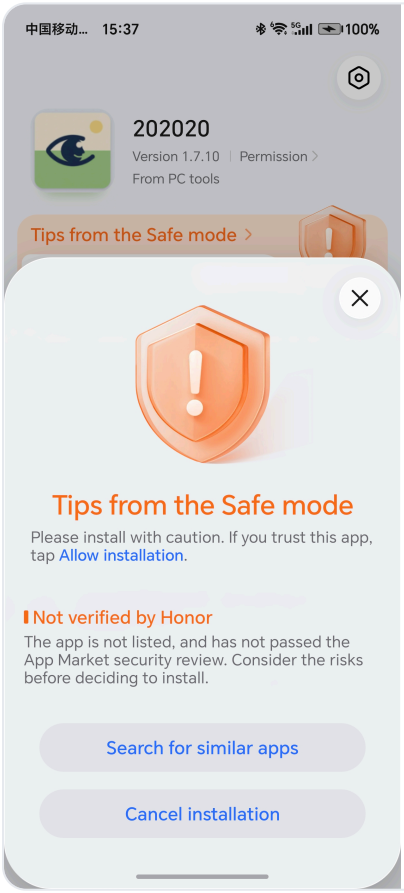

3 ACKNOWLEDGE

Tick the risk acknowledgement

Tick **I acknowledge that the app has not undergone security check and may pose potential risks.**

> Tap the checkbox so it turns solid blue; **Install** becomes tappable.

4 SAFE MODE

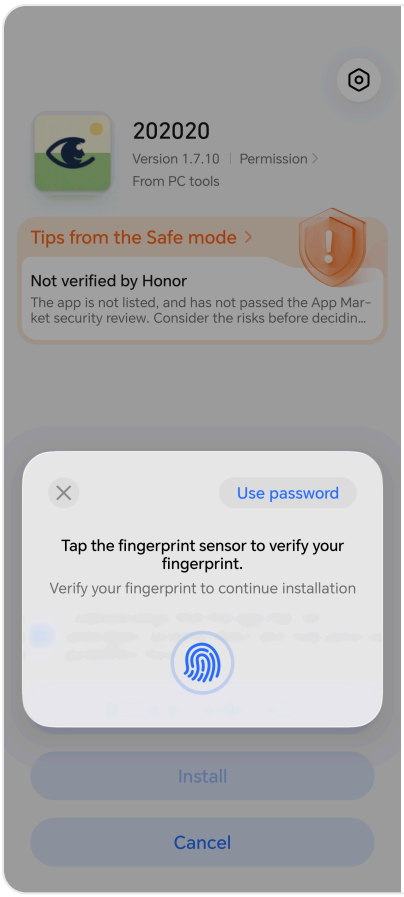

Tap Install, then tap "Allow installation"

Tap **Install**. A **Tips from the Safe mode** card slides up from the bottom, repeating that the app was not market-reviewed. **Key point:** the way to proceed is not a bottom button — it is a blue link inside the sentence.

The text reads: "...If you trust this app, tap **Allow installation**." — **Allow installation** is the tappable blue text.

> Tap the blue **Allow installation** link in the body text. (**Cancel installation** at the bottom aborts.)

> **Where most people get stuck:** the link looks like part of the sentence, so it is easy to overlook — then "nothing happens" when tapping Install.

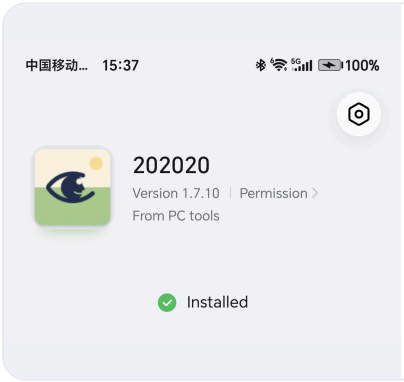

5 VERIFY

Verify with your fingerprint or password

The system asks for identity verification: "Tap the fingerprint sensor to verify your fingerprint". This system-level confirmation appears only for non-market installs.

> Touch the fingerprint sensor; if fingerprint is unavailable, tap **Use password** and enter your lock-screen password.

> **Do not press Back** while this dialog is up — cancelling verification aborts the install and you must redo Step 4.

6 INSTALLED

A green check mark means success

When you see the green check and **Installed**, the app is on the phone. Tap **Done** to leave the installer; the **202020** icon is now on your home screen.

> **Ignore the maintenance cards below this point on your phone**: they come from the phone's cleaner app and have nothing to do with the installation. **Do not** tap Fix all / Clean up — they may remove other apps or wipe data.

After installation

- **Grant permissions on first launch:** display over other apps (floating ball), accessibility, usage access, and background / auto-start. The timer and floating ball will not work properly if any of these is missing.
- **Pure mode:** if the system says "Pure Mode is on and blocks unknown-source installs", turn it off under `Settings → System & updates → Pure Mode`, then repeat Step 1.
- **Upgrades:** a new version with the same signature installs directly over the old one and keeps your data. If you see "signature mismatch", uninstall the old version first (this clears local settings and statistics).
- **About "From PC tools":** seeing this on the installer page means the APK was transferred through a PC / debugging channel; it does not affect the app. When the APK comes from a chat app or cloud drive, that app's name is shown instead.

Troubleshooting

Install is grey and does not respond

The risk acknowledgement (Step 3) is not ticked yet. Tick it; if it is already ticked, close the installer and reopen the APK.

Tapping Install seems to do nothing

What you need is not a button but the blue **Allow installation** text link inside the Safe mode card.

The fingerprint dialog flashes away / verification fails

Usually caused by pressing Back or another app taking the foreground. Reopen the APK and repeat Step 4; use **Use password** if fingerprint is not available.

"App not installed" or "There was a problem parsing the package"

The APK file is incomplete or incompatible with your Android version. Transfer the file again; if it still fails, try a different build.

"Signature mismatch" — cannot install

A version with the same package name but a different signature already exists (e.g. release vs. debug). Uninstall the old one first; uninstalling clears local data.

Installed, but the app crashes on launch

Check that all permissions listed above are granted; then look at `Settings → Apps → 202020 → Permissions` for anything denied, grant it, and open the app again.
